The Inspiration: Mimicry

History

Henry W. Bates first published in 1862.

- ► **Content:** Similarity and dissimilarity between Heliconiinae and Ithomiinae butterflies.
- ▶ Bates collected 94 species of butterfly.
- Grouped according to similar appearance.
- ▶ Discovery: Appearance: similar, Morphological feature: different species.
- ▶ 67 of 94: Ithomiinae.
- ▶ 27 of 94: Heliconiinae.

The Inspiration: Mimicry

Batesian Mimicry

- Heliconiids are,
 - conspicuously colored
 - extremely abundant
 - slow in mobility.
- Predators, insectivorous birds do not prey on Heliconiids.
 - Reason: Inediblity and unpalatability.
- Heliconiids are easily recalled by predators.
 - ▶ Reason: Conspicuous coloration.
 - Color acts as warning.
- Ithomiinae and Pieridae are,
 - edible
 - palatable
 - pretend like Heliconiids, enjoy protection.

Batesian Mimicry

According to Wilcker:

Actor is a mime.

▶ False representation of warning pattern: Mimicry.

▶ Bates: First to point out, so Batesian Mimicry.

Model: Animal avoided by predator for unpalatable behavior.

Mimic: Imitating animal.

FormAL Prey Predator

Results

Experiments Analysis

► Two inedible unrelated butterfly species have similar appearance.

- Bates: Unable to explain.
- Explanation: from Fitz Muller in 1878.
- Muller's research was also in Brazil.

Explanation:

- Predator's limited memory.
- Inedible species loose number.
- Save loss and survival of species:
 - inedible, different family
 - evolve to have similar appearance.
- Phenomenon: Mullerian mimicry, named after Fritz Muller.

The Model

FormAL Prey Predator

Results

Experiments Analysis

- ► Turner: Synthetic theory.
- Originated from Poulton and Nicholson.
- Mimicry arises in two steps:
 - A comparatively large mutation achieves a good approximate resemblance.
 - 2. A gradual evolutionary change refines the resemblance to a higher degree of perfection.
- Theory also applied to Mullerian Mimicry.

The Model

FormAL Prey Predator

Results

Experiments Analysis

- Examine the local butterfly fauna in any area of the world
 - ▶ all the aposomatic species
 - limited number of different patterns
 - normally far smaller than the number of species.
- Mullerian mimicry ring:
 - Each cluster of species
 - ▶ all sharing a common pattern
- ▶ All the rain forest in South and Central America,
 - most of the long winged butterflies (ithomiids, danaids and heliconids)
 - belong to one of only five different rings.

The Model

Evolution of Mimicry

▶ **Objective:** Build an *agent based* Artificial Life model for simulating the evolution of mimicry.

- ► Two species of agents:
 - 1. Prey
 - Model
 - Mimic
 - 2. Predator
- Prey pattern representation: Cellular Automata.
- Predator pattern recognition: Hopfield Network.
- ▶ Environment: Visual representation, 3D, toroidal.

FormAl Framework

(FormAL) project.

Modeling the Evolution of Mimicry

Islam, Grogono

FormAl

Principal not followed for Hopfield Network. Agents:

Goal:

Simulated organism.

Reproduce itself using genetic information.

▶ Ideas from Peter Grogono's Formal Artificial Life

Study the emergence of complexity.

 Capable of modifying structures of genome between generations.

No variable unless genetically controlled or influenced.

- Interaction with other agents.
- Survive and reproduce in a challenging environment.

FormAL Framework

Environment - Visual representation - Front

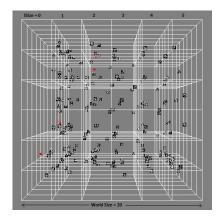

Figure: Three dimensional representation of the environment divided in cells. Presence of different species of agents inside.

Prey Predato

Results

Experiments Analysis

- ▶ Pattern genome is 8 bit binary. Decimal range 0 to 255.
- ▶ 256 unique CA pattern.
- Linear representation of pattern stored in Hopfield Network.
- Pattern similarity: Hamming distance between linear representation.
- Single species: group of prey with a specific pattern.
- ▶ Inter species reproduction: restricted to control diversity of patterns.
- "Pattern Mutation Rate": control diversity of new species.

Prey Pattern

Genotype vs. Phenotype

- Genetic bit difference of one.
- Vastly different phenotype.

CA Rule	$60 \equiv 00111100$	$61 \equiv 00111101$	$62 \equiv 001111110$
Pattern	E-2 E-2 E-2 E-2 E-2 E-2 E-2 E-2 E-2 E-2

The Prey: Mimics and Models

Punctuated Equilibrium

Punctuated Equilibrium:

- inclined to cladogenesis instead of gradualism.
- ► Turner's emphasis on punctuated equilibrium to explain evolution of mimicry.
- CA pattern evolution: single mutation in the pattern genome.
- ► Change of pattern:
 - ▶ not gradual
 - arbitrary discontinuous

FormAL Prey Predator

_

Experiment:

onclusion

4 D > 4 A P > 4 B > 4 B > 9 Q C

- Agent in the FormAL environment.
- Provide selection pressure for the evolution of mimicry.
- Equipped with Hopfield Network Memory.
- Mobility and reproduction capability controlled genetically.
- Unable to represent pattern recognition capability with genome.
- New predators are born with zero memory, as memory is not inherited.

The Predator

Learning

- Predator's interaction objective with prey is consumption.
- Consumption is based on palatability.
- If unable to consume prey is thrown back into environment.
- Store prey pattern into memory with the associated palatability.
- ▶ New pattern learned with Hebbian Learning.

Modeling the Evolution of Mimicry

Batesian Mimicry
Mullerian Mimicry
Mimicry Ring

FormAL Prey Predator

Results

Experiments Analysis

Predator

- Input to Memory:
 - Each prey has an evolving CA represented by a binary Genome
 - 2D pattern is serialized to a 1D binary array.
 - Binary representation converted to bipolar representation.
- Pattern Recognition with Hopfield Network:
 - Learning: Apply Hebbian learning to calculate weights.
 - Initialization: Input to network initialized with input vector.
 - Iterate Until Convergence: Asynchronous update of each neuron. Input: previous state.
 - Output: Finally a pattern is set as output when the network reaches convergence.

Predator

- Agent reaches 'Minimum Attack Age' it starts hunting.
- Select a random prey within vicinity (same cell).
- Involves recognition of prey pattern.
- Pattern memorization and recognition process: computationally expensive.
- Two parameters to limit
 - Hopfield Minimum Memory Size (value 2 to 6)
 - Hopfield Maximum Memory Size (value 10)
- New predator attacks without caution.
- Attacks everyone and in the process store pattern and palatability.
- ▶ When memory reaches 'Hopfield Minimum Memory Size': intelligent selection.

FormAL Prey Predator

Results

Experiments Analysis

Conclusion

Conclusion: This model can simulate evolution of Batesian Mimicry.

Batesian Mimicry has taken effect, for all possible initial

Every ring of unpalatable species there is a palatable

Start with palatable population, prey reaches extinction.

Reason: No models to mimic for palatable species.

Analysis

Mullerian Mimicry

"Mullerian mimics converge into one large ring."

- Initialize simulation with 4 unpalatable species. No palatable ones.
- After 10k iteration all unpalatable species survive with dominance.
- ▶ **Reason:** Predator minimum memory configuration set to 4.

New experiment:

- Reduce predator memory to 1.
- ▶ **Observation:** Single large ring do not occur.
- Conclusion: Similar to Franks and Noble. Multiple Mullerian mimics do not converge into one large ring.

Conclusion

Artificial Life:

- Tool for biological inquiry
 - Success: Proof of Turner's punctuated equilibrium
 - Proof of Franks and Noble's converge of one large ring.
- Nature inspired computer science
 - Success: Appropriate emulation of Batesian and Mullerian mimicry.
- Solve problem in computer science
 - ▶ Not successful: unable to find the appropriate problem solving scenario.
